[Update Syncaine TM-200X to latest version for Windows 8]) Nowadays, broadband access service providers are moving towards all-IP-based networks for providing broadband services. This type of service, which provides access to high-speed Internet and the like, provides users with the ability to access video content on the Internet by using a wideband connection. In particular, due to the high bandwidth capability of the all-IP-based network, the service providers can provide various services, such as IPTV, video-on-demand (VoD) and the like, which allow users to access an IP network using the same wideband Internet connection. The all-IP-based network enables users to be connected with a variety of Internet service providers that use the Internet to provide services via various connections. In particular, if a user accesses the Internet using a personal computer (PC) connected to a wideband connection, the PC is connected to an Internet Service Provider (ISP) through a modem. Thus, the user is allowed to obtain various services, such as video content, using a wideband connection. However, a user who uses a PC to access the Internet cannot experience the same degree of service satisfaction as he/she would experience by using a set-top box. That is, since a PC cannot provide a wideband Internet connection, the PC is not able to provide services that can
